1. Introduction

1.1. Project Overview

This project aims to design and develop an inventory management system for Datu Shop. Datu Shop is a Micro-Small-Medium Enterprise (MSME) located in Quezon City, focusing on procuring and selling various motorcycle parts and servicing said parts to their customers. The software system will have to perform the following functions to assist the company in solving its current issues:

1. Handle the inventory of the motorcycle supplies supplied to and from the shop for easy access and recording.
2. Display a dashboard with analytics regarding shop sales, high-selling products, and low-stock products.

Included in this document are several essential aspects to be considered and addressed during the development period of the software system, which include the following: critical deadlines of the development process, the structure of the organization in charge of the development, and their responsibilities, the resources to be used during the development process, and the deliverables to be submitted to the client.

1.2. Project Deliverables

In fulfillment of the project, the following requirements and deliverables in the tables below will be completed and submitted to the client and professor in charge of the group.

Table 1.1 Documentation Table

| Deliverable | Date | Description |
|---|-------------|--|
| Software Project Management Plan (SPMP) | | Provides critical information related to the project, including project overview, process model used, organizational responsibilities, risk management strategies, and project schedule. |
| Software Requirements | | Describe the system's requirements, |

| | | |
|--------------------------------|------------------------|--|
| Specifications (SRS) | First Semester | scope, and features to be delivered to the client. |
| Software Design Document (SDD) | | Illustrates the software system's overall design, including its architecture, scope, and features. |
| Software Test Plan (STP) | Second Semester | Lists the cases in which the developed system will be tested and the method in which the cases will be tested. |
| Software Test Document | | Includes a derivation of the STP but includes the test cases used. |

Table 1.2 Software Deliverables Table

| Deliverable | Date | Description |
|---|------------------------|---|
| Datu Shop Inventory Management System Prototype | First Semester | Includes a working prototype of the system to see the various parts of the system to be developed in action. |
| Datu Shop Inventory Management System Working Version One | Second Semester | Includes the complete and fully functional version of the software system, which will be delivered to the client for use. |

2. Project Organization

2.1. Process Model

The process model decided by the developers to be used for this project is the Agile Development Methodology. The Agile Development Methodology is a collection of beliefs and concepts that strongly emphasize self-organizing teams, collaboration, and adaptation to change. It is the understanding that the same approaches and the capacity to adapt to change and uncertainty will only sometimes work. The Agile Methodology has five phases during each iteration: Requirements Gathering, Planning and Designing, Development, Testing, and Evaluation.

AGILE SOFTWARE DEVELOPMENT

Figure 2.1: Agile Development Methodology Model

Listed below are the phases of each iteration of the Agile Development Methodology life cycle:

1. Requirements Gathering

- This phase focuses on gathering the requirements needed to complete the project. The problems to be addressed and possible solutions will be identified during this phase. This also includes vital information regarding development, such as the project's scope, features, and timetable.

2. Planning and Designing

- Upon identifying the significant requirements of the project, the overall design of the project will be tackled in this phase. This phase of the project includes the conception of the Software Design Document (SDD), which illustrates the

planned flow of the software itself. The SDD will consist of the system architecture, mockups of the software itself, and use cases of the system to be developed.

3. Development

- The development phase is the most extended phase for each iteration during the Agile Software Development life cycle. This part of the cycle includes the actual development of the software using the design created in the planning and design phase. All aspects of the software, such as the front-end and back-end parts of the system will be developed in this phase.

4. Testing

- This cycle phase involves testing the developed system for bugs and possible sources of errors. The quality assurance officers will spearhead this phase to ensure the code is clean, creating test cases for the system for possible bugs. The development team will use the Software Test Plan as a reference during this phase of the iteration.

5. Evaluation

- The last phase of each iteration focuses on identifying possible room for system improvement. The development team and the client will examine for bugs in the system, possible new features, and quality-of-life changes to be implemented in the next cycle iteration.

There are numerous advantages to applying the Agile Development Methodology in this project. First, the priority of this approach is to fulfill the client's needs by promptly and consistently delivering high-quality outputs, which means that despite delays in development, this approach welcomes changes for the customer's competitive advantage. Second, this approach continually shows the project's results, not just its final output. This allows the customer to see the project and see if changes must be made. Third, based on the time intervals set, the team can reflect on becoming more effective and adapting accordingly.

The disadvantages of applying the Agile Development Methodology in this project include the following: First, the project can be less predictable due to the changes or demands that may happen between the phases. Second, this approach requires the time and commitment of both the team and the customer to communicate to ensure the project's quality throughout the development.

2.2. Organizational Structure

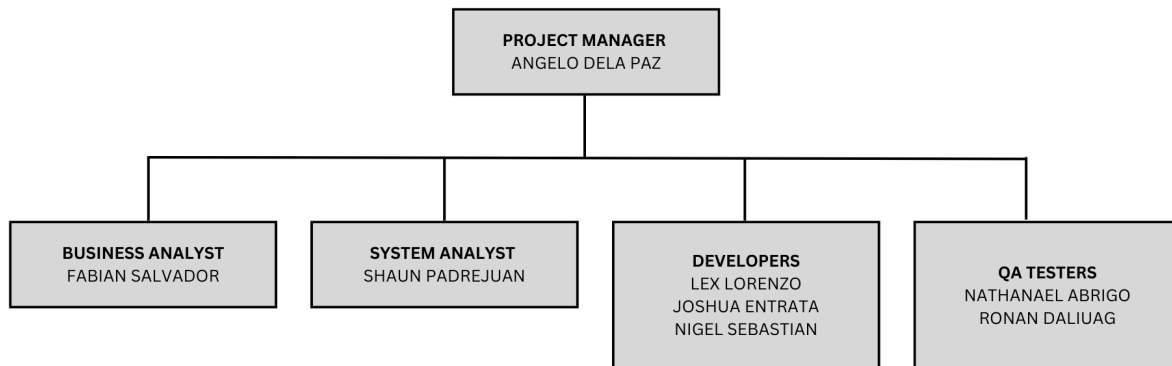

Figure 2.2 Tigre Tech Organizational Chart

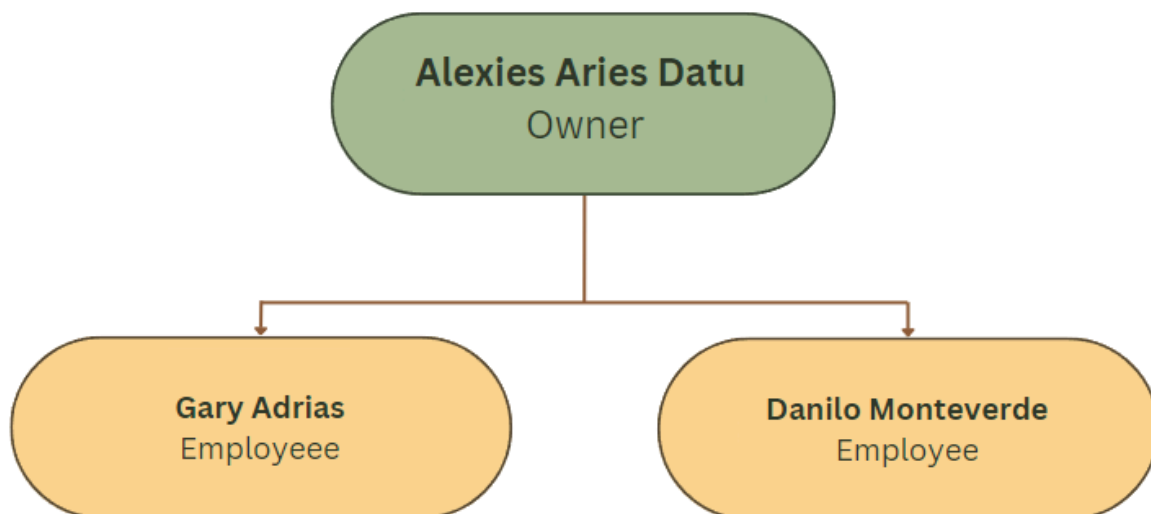

Figure 2.3 Datu Shop Organizational Chart

2.3. Project Responsibilities

Table 2.1. Project Responsibilities

| Role | Name | Responsibilities | Deliverables |
|-------------------------|----------------------------|---|--|
| Project Manager | Angelo Dela Paz | Spearheads the creation of the whole project. Manages and oversees task allocation, project scheduling, and client communication (along with the business analyst) | timetable of the Project and Documentation (Software Project Management Plan, Validation Board). |
| Business Analyst | Fabian Salvador | Leads the communication efforts with stakeholders, being the most well-versed in business jargon and processes. Responsible for laying the groundwork and translating the requirements stated by said stakeholders for easier understanding of the system required. | Transcript of Meetings, Client-related Letters, Documentation (Software Requirements Specifications) |
| Systems Analyst | Shaun Kristoffer Padrejuan | Analyzes the business requirements and leads the system | UML Diagrams, System Design, and Model Documentation |

| | | | |
|-----------------------------------|------------------------|---|---|
| | | design efforts. Identifies the hardware and software requirements and supersedes the PM in overseeing the actual implementation of the system | (Software Design Document) |
| Software Developers | Joshua Kyle Entrata | Develops the system following the design model of the Systems Analyst. | System Prototypes, Documentation |
| | Lez Zedrick Lorenzo | | |
| | Nigel Haim Sebastian | | |
| Quality Assurance Officers | Nathanael Chris Abrigo | Manages the quality control of the outputs presented by the team. Inspects the system for issues and/or errors and resolves said issues | System's Error and Validation Reports, and Documentation (Software Test Plan) |
| | Ronan Manuel Daliuag | | |

3. Managerial Process

3.1. Management Objectives and Priorities

The project's primary objective is to create an inventory management system for Datu Shop that automates several critical processes related to the company's business practices. This primary objective may be fulfilled by developing a system with the following functions:

- An inventory management system will be used by the employees of the motor shop to track the flow of product stocks.
- The inventory system will notify users of any low product stock.
- The inventory system will include a dashboard for the admins to see current sales analytics using various graphs.

To further visualize the project's scope, shown below is a validation board that contains the problems discussed with the client and the proposed solutions that will be implemented through the development of the proposed system.

| JAVELIN BOARD | | method created by leanstartupmachine | | Project Name: Datu Shop Inventory Management System | | Team Leader Name: Angelo Dela Paz | | | |
|--|--|--------------------------------------|--|--|---|---|--|---|---|
| Start here. Brainstorm with stickies, pull it over to the right to start your experiment. | | | | Experiments | 1 | 2 | 3 | 4 | 5 |
| Who is your customer? <small>Time Limit: 5 Min</small> | | | | Customer | Owner | | Employee | | |
| What is the problem? Phrase it from your customer's perspective. <small>Time Limit: 5 Min</small> | | | | Problem | Computation of sales and profit is difficult | Tracking of motorcycle parts is tedious | Difficult to track updates to stock | | |
| Define the solution only after you have validated a problem worth solving. <small>Time Limit: 5 Min</small> | | | | Solution | Create a sales dashboard for computation of finances | Create inventory system for easy parts tracking | Inventory System with adding, removing, editing features | | |
| List the assumptions that must hold true, for your hypothesis to be true. <small>Time Limit: 10 Min</small> | | | | Riskiest Assumption | Sales and profit are computed manually | Motorcycle part entries are handwritten | No organized way of tracking updates | | |
| Need help? Use these sentences to help construct your experiment. | | | | Success Criterion | INTERVIEW: /1 Agree to sales dashboard | SURVEY: /3 Agree to online inventory system for shop | | | |
| To form a Customer/Problem Hypothesis: I believe <u>my customer</u> has a problem <u>achieving this goal</u> . | | | | GET OUT OF THE BUILDING! | | | | | |
| To form a Problem/Solution Hypothesis: I believe <u>this solution</u> will result in <u>quantifiable outcome</u> . | | | | Result & Decision | PERSEVERE: 1/1 Agreed to sales dashboard | PERSEVERE: 3/3 Agreed to online inventory system | | | |
| To form your Assumptions: In order for hypothesis to be true, <u>assumption</u> needs to be true. | | | | Learning | Open to having a computerized inventory system for the motor shop | Open to having a computerized inventory system for the motor shop | | | |
| Determine how you will test it: The least expensive way to test my assumption is... | | | | | | | | | |
| Determine what success looks like: I will run experiment with <u># of customers</u> and expect a strong signal from <u># of customers</u> . | | | | | | | | | |

Figure 3.1 Validation Board

3.2. Assumptions, Dependencies, and Constraints

This document section provides the assumptions, dependencies, and constraints the development team will follow throughout the duration of the development.

3.2.1. Assumptions

The project has the following assumptions before continuing the project:

- The employees and admins of Datu Shop will use the system.
- Orders can be placed for inventory items that are not in stock.

3.2.2. Dependencies

The system will depend significantly on the availability of an internet connection within the shop. The system will be entirely online; therefore, the absence of the Internet would mean the users of the system would be forced to use other means. In the event of this, the users would opt to return to handwritten means in the meantime.

3.2.3. Constraints

The project constraints are the following:

- The system to be developed is not fully digital; therefore, clients would still need to go to the actual shop for any services.
- The logging of new inventory stock is not automatic.

3.3. Risk Management

The risk management section aims to identify the possible risks of project development. Such risks are mostly interrelated to the complexity and potential impact on the project development. Below is the table that shows the assessment and the significance of the possible problems that may arise during the project's development.

Failure Possibility Legends:

High

- The possibility is likely to occur. The developers need to prioritize finding a solution.

Medium

- The possibility could occur during the development. Attention is necessary to resolve the problem.

Low

- Failure in the development is not likely to happen. The implementation will be smooth to focus on other requirements.

Project Impact Legends:

High

- Failure to satisfy the requirements of the client

Medium

- Can be decided in the future whether it is still required due to constraints.

Low

- When failure occurs, it will not significantly affect. The requirement can be excluded at times due to constraints.

Table 3.1. Risk Management Table

| Problem | Failure Possibility | Project Impact | Mitigation Technique |
|---|----------------------------|-----------------------|--|
| Difference of Schedule Availability | Medium | High | Meetings will be scheduled ahead of time and when most members and the client are available. |
| Absence of the Owner | Medium | High | Due to the nature of the owner's job, the owner may have to go to various places and be absent for some periods. The mitigation technique used to solve this problem is to have a proxy for the owner who can make decisions other than the owner. |
| Skill Deficiencies Among the Development Team | Medium | High | Since the development team are college students, they will learn and study the current technology trends. Merging their learnings from other sources and learning from the curriculum implemented by the university. |
| Server Integration | High | High | Integrating the server requires |

| | | | |
|-------------------------------|--------|--------|---|
| | | | payment (monthly or annually) and maintenance. The developers will implement an affordable and secure server for the database and hosting. |
| Manual to Digital Integration | Medium | High | The team will understand the ins and outs of the process used by the client's staff and ensure that it is found in the inventory management system. |
| Staff Training | Low | Medium | The team will teach the staff and the owner the system's capabilities. |

3.4. Monitoring and Controlling Mechanisms

The project will be monitored through Notion to keep track of progress, tasks, and assigned members. Each change in the program will be observed through the project's documentation. Upon the start of the development period, Git and Github will be used by the programmers for version control and could act as an online repository for collaborative work. Both front-end and back-end developers will push their source codes to the repository, pull, and review them before merging each branch to the origin before testing. Revisions will be recorded on the project's documentation and in the repository during testing.

Communication between the members of the group is through messenger. The members' concerns will be discussed through the group chat created. Members of the group are also updated on tasks completed and tracking deadlines. A separate group chat will be created for the members to communicate with the client. Further group inquiries on the business details are asked through the group chat. Concerning the privacy and information this project includes, all inquiries, messages, and information within the group are confidential and archived upon completion.

The repository of documents and relevant files regarding the initial designs and diagrams of the project is stored in a Google Drive Folder and Figma Project, respectively. All necessary

drafts, such as the SPMP, SRS, and SDD, are stored in Google Drive, the web application mockups and relevant diagrams are found in the Figma Project, and the actual source code used for the project will be stored in the Github repository.

4. Work Packages, Schedule, and Budget

4.1. Work Packages

Found in the table below are the significant tasks delegated to the developers throughout the duration of the conception and development of the project. Each task is given a certain number of days to be completed for a systematic and organized workflow between the developers and the client.

Table 4.1 Work Packages Table

| Activity | Deliverables |
|--|-----------------------------------|
| Preliminaries | |
| Creation of Letters for the Client | Proposal Letter |
| | Certification of Non-Relation |
| | Interview Letter |
| Interview | Transcript |
| Discussion of Possible Solutions and Approach | |
| Development Team Meeting | Initial Validation Board |
| Meeting with Client | Validation Board with Experiments |

| | |
|--|--|
| Data Gathering for the new action plan of javelin board | Complete Validation Board |
| Aesthetics, Designs, and Functionality | |
| Discussion of Use-Cases | Use-Case Diagram and Use-Case Descriptions |
| Initial SRS | Initial Software Requirement Specifications Document |
| Discussion of Design with the client | Transcript |
| Creation of Prototype | Prototype System |
| Presentation | Validated Prototype System |
| Project Defense | Proposal Defense |
| Revised Documentation | Software Project Management Plan |
| | Software Design Document |
| | Software Requirement Specifications |
| | Software Test Plan |
| Implementation and integration of systems | |
| Front - End Design Implementation | Front-end of the System |
| Back - End Design Implementation | Back-end of the System |
| System Testing | Successful Test Cases |
| Project Defense | Final Defense |
| Final Revisions | Final Documentation |
| Project Deployment | System Installation |
| | Maintenance Training |

4.2. Dependencies

Table 4.2 Project Dependency Table

| Letter | Activity | Prerequisites |
|----------|----------------------------------|---------------|
| A | Finding a Client | - |
| B | Proposal Letter | A |
| C | Certificate of non-relation | |
| D | Interview Letter | |
| E | Interview with the Client | B C D |
| F | Validation Board | E |

| H | Use-Case Diagram | G |
| I | Use-Case Description | H |
| J | SRS | I |
| K | SDD | J |
| L | Project Defense | G, J, K |
| M | Revised Documentation | L |
| N | Start of Front-End Development | M |
| O | Start of Back-End Development | M |
| P | System Testing | N, O |
| Q | Final Defense | P |

| | | |
|----------|--------------------------------|----------------|
| R | Final Documentation Submission | Q |
| S | System Installation/Training | N, O, P |

4.3. Resource Requirements

The proposed Datu Shop Inventory Management System will have the following requirements. The developers will need a machine to code the website properly, develop the data analytics, and make a coherent database process to ensure orders will be given and received by the business's necessary people. A web domain is needed to host the website, along with a database for the orders and the data analytics. Regarding software, the developer will need IDEs and SDKs to develop the deliverables.

Table 4.3 Resource Requirements Table

| RESOURCE REQUIREMENTS | | | |
|------------------------------|-------------------------------|---------------|--|
| Type of Resource | Resource Details/Specs | Source | Assumptions |
| Software | Python Django | Internet | Expertise in this backend framework |
| Software | React | Internet | Expertise in this frontend library |
| Software | PostgreSQL | Internet | Expertise in database administration |
| Software | Figma | Internet | Expertise in using this tool to design and create prototypes |

| | | | |
|-------------------|---|----------------------------|---|
| Hardware | Personal Computers or Laptops | Group Members | Members have their own devices that is capable of developing and testing the system |
| Software/Hardware | Internet | Internet Service Providers | Everyone must have an internet access |
| Person | Development Team (<i>Project Manager, System Analyst, Business Analyst, Web Developers, Quality Assurance Testers</i>) | Group Members | Capable of fulfilling their responsibilities and tasks |
| Person | Motoshop Mechanics | Client | Trained to use Inventory Management System |
| Person | Owner | Client | Involved in the development and implementation of the system |

4.4. Resource Allocation

Table 4.4 below shows the breakdown of how the developers are assigned to a specific activity in the project's development. Some activities and documentation are managed by one lead, while the other developers may help complete the document.

Table 4.4 Resource Allocation Table
